Total	22,330	0	63	2,160

Survey

- Survey teams continue to implement a rigorous detection and delimiting survey for the light brown apple moth (LBAM), *Epiphyas postvittana*, in 44 counties.
- 22,330 pheromone-baited traps have been deployed to date. Traps are placed in and around retail and production nurseries, at ports of entry, and in the open environment and are being inspected bi-weekly.
- Visual inspections of all nurseries located within 1.5 miles from any traps with confirmed LBAM are conducted for the presence of any life stages.

• Identification and Diagnostics

- Trapped moths are forwarded to the California Department of Agriculture's (CDFA) Plant Pest Diagnostics Laboratory for the initial identification. All LBAM "presumptive positive" moths from each county are forwarded to the ARS Systematic Entomology Laboratory (SEL) in Washington, DC, for confirmation. In counties where previous specimens have been confirmed by SEL, subsequent captures are identified by CDFA.
- A total of 2,160 moths have been confirmed to date as LBAM. Most of the captures (92%), however, are from traps located in two specific geographical areas. The first area, representing 80% of the captures, is confined to a small section of southern Santa Cruz County. The second area, which represents approximately 12% of the all LBAM captures, includes the contiguous northwest Alameda, western Contra Costa, southeastern Marin, and northern San Francisco counties. The remainder (8%) came from mostly single trap captures in Monterey, Napa, San Mateo, and Santa Clara counties.
- LBAM immature life stages, including larvae and pupae have been found in a total of ten (10) nurseries, cut flower or greenery farms in Monterey, San Francisco, Santa Clara, and Santa Cruz.

Operational Update:

• Technical Working Group (TWG)

- APHIS has assembled a team of subject matter experts from the United States, Australia, and New Zealand to provide recommendations on survey methods, mitigation tools, and eradication strategies. The TWG toured the infested region yesterday (May 16) and began its two-day meeting today (May 17-18) in San Jose, California.

• Incident Command

- A total of 112 personnel are on-site (82-CDFA/Counties; 30-APHIS) assuming various roles within the ICS structure.

• Regulatory Actions

- CDFA, APHIS, and County personnel continue to conduct inspections and certification of host commodities in the quarantine areas as required by State LBAM regulations and by the Federal Quarantine Order.
- To date, CDFA has issued a total of 182 compliance agreements to establishments located within the quarantine area requiring regular inspections of all nursery stock and report to regulatory officers any suspect LBAM.

• Trace-back and Trace-forward

- Trace-back and trace-forward investigations to determine the source and potential distribution of LBAM continue, including the inspection of nursery establishments.
- On May 17, 2007, a nursery in Los Angeles County was inspected because it had received plants from an infested production nursery in Santa Cruz County. The Los Angeles County nursery was determined to be free of LBAM infestation. In the meanwhile, traps were placed onsite for additional monitoring.

• Treatment

- Nurseries with host plants that are confirmed as infested with LBAM larvae or pupae are being treated with Chlorpyrifos.
- EPA has issued a "Section 18" exemption for ISOMATE, one of the pheromone formulations used for mating disruption and eradication.
- CDFA and APHIS are in the process of finalizing LBAM eradication strategies using mating disruption and other control measures.

Trade Update:

APHIS informed trading partners of the LBAM finds in California. Additional reports
were provided to Canada and Mexico in response to their requests for additional
information. A team from Canada visited California on May 9-11 to view the LBAM
response activities. A team from Mexico is scheduled to arrive next week.

Communication and Outreach:

Public Information Officers (PIO) and officials from CDFA, APHIS, and Counties
continue to field questions from the press and the public regarding the LBAM finds
and the regulatory framework.

Rockground

Background:

• On February 6, 2007, a private citizen near Berkeley in Alameda County, California, reported that two suspect moths had been captured in a blacklight trap on his property.

- In response, pheromone-baited traps were placed on March 1, 2007, in Alameda and Contra Costa counties. Trap inspections began March 7, 2007.
- On March 16, 2007, the ARS Systematic Entomology Laboratory (SEL) in Washington, DC, confirmed that the two samples submitted were positive, and validated the results using morphological testing.
- USDA and CDFA issued press releases on March 22, 2007, announcing the confirmation of LBAM in California. APHIS. Also, APHIS issued a SPRO letter informing States and stakeholders of the LBAM in California.
- CDFA established on April 20, 2007 a LBAM quarantine of at least 182 square miles in Alameda, Contra Costa, San Francisco, Marin and Santa Clara counties. The quarantine is expected to expand to include Monterey, Santa Cruz and San Mateo counties.
- APHIS issued a LBAM Federal Quarantine Order on May 2, 2007, requiring inspection and certification of all nursery stock and host commodities from eight counties in California, including Alameda, Contra Costa, Marin, Monterey, San Francisco, San Mateo, Santa Clara, and Santa Cruz counties.
- The light brown apple moth (LBAM), *Epiphyas postvittana*, is a native pest of Australia and is now widely distributed New Zealand, the United Kingdom, Ireland, and New Caledonia. Although it was reported in Hawaii in the late 1800s, the LBAM find in California is the first on the US mainland.
- If left uncontrolled, LABM could cause significant damage to some 250 plant species, including stone fruit (peaches, plums, nectarines, cherries, and apricots), pome fruit (apples and pears), grapes, and citrus.
